Non-nucleoside reverse transcriptase inhibitorsTechnical field

This invention relates to non-nucleoside reverse transcriptase inhibitors active  
5 against HIV-1 and having improved pharmacokinetic properties. The invention  
further relates to the synthesis of such compounds and their use in antiviral  
methods and compositions.

Background to the invention

10 Non nucleoside reverse transcriptase inhibitors (NNRTI) bind to an allosteric  
site on reverse transcriptase and represent an important development in the  
arsenal of drugs against HIV, particularly HIV-1. International patent  
application WO 93/03022, discloses thiourea NNRTI, later denoted PETT  
(phenyl ethyl thiazolyl thiourea) compounds in J Med Chem 39 6 1329-1335  
15 (1995) and J Med Chem 39 21 4261-4274 (1996). International patent  
application no WO95/06034 discloses urea isosteres of PETT NNRTIs.  
PCT/SE99/00053 published after the priority and international filing dates of  
the present application discloses particularly active urea NNTRI compounds  
with the formula:

20

wherein

R8 is halo;

R9 is C<sub>1</sub>-C<sub>3</sub> alkyl;

25 R10 is halo, especially bromo or cyano.

The contents of each of the above documents are specifically incorporated by  
reference.

Although the urea and thiourea NNRTI disclosed in the above documents are extremely active against reverse transcriptase, especially that of HIV-1, the nature of the HIV virus with its extreme lack of replicative fidelity and consequent tendency to rapid resistance development prompts a demand for further antiretroviral agents. Additionally, modern HIV therapy regimes, denoted HAART, Highly Active Anti Retroviral Therapy, administer antivirals as combinations of three or more antivirals of various classes, which combinations are administered for prolonged periods, if not for life. HAART requires the patient to follow a complicated dosing schedule with sometimes dozens of tablets per day taken at various times of the day in some cases before and in other cases after the ingestion of food. There is thus a need for antiretroviral preparations allowing greater flexibility in dosing to facilitate patient compliance.

To pursuit of such flexibility of dosing, the abovementioned PCT/SE99/00053 proposes certain prodrugs of the compounds of formula P2 above building on the phenolic hydroxy group. These prodrugs comprise aminobenzoyl or pyridyl esters of this phenolic hydroxy, wherein the amino group may be optionally substituted with an amino acid peptidically bound thereto.

#### Brief description of the invention

We have now discovered that a particular class of prodrug provides enhanced pharmacokinetic performance in respect of NNRTIs of the PETT class.

Accordingly a first aspect of the invention provides compounds of the formula P1:

P-1

Ar1 is an unsaturated, optionally substituted, mono or bicyclic ring structure comprising 0 to 3 hetero atoms selected from S, O and N;

Ar2 is an aromatic, optionally substituted, monocyclic ring structure comprising at least one nitrogen hetero atom and zero to two further hetero atoms selected from S, O and N;

R4 and R5 are independently H, a substituent selected from C<sub>3</sub>-C<sub>8</sub> cycloalkyl, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>8</sub> alkynyl, C<sub>1</sub>-C<sub>5</sub> alkoxy, C<sub>1</sub>-C<sub>4</sub> alkanoyloxy, C<sub>1</sub>-C<sub>4</sub> alkylthio, amino, carboxy, carbamoyl, cyano, halo, hydroxy, aminomethyl, hydroxymethyl, carboxymethyl, or halo substituted C<sub>1</sub>-C<sub>6</sub> alkyl mercapto, nitro, or R4 and R5 join to form a 3 – 6 membered , optionally substituted ring structure;

- 5 The optional substituents described herein conveniently comprise up to three substituents selected from C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>8</sub> alkynyl, C<sub>2</sub>-C<sub>8</sub> alkenoxy, C<sub>1</sub>-C<sub>6</sub> alkoxy C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkanoyl, haloC<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>4</sub> alkanoyloxy, C<sub>1</sub>-C<sub>4</sub> alkylthio, amino, carboxy, carbamoyl, cyano, halo, hydroxy, aminomethyl, carboxymethyl, hydroxymethyl, nitro, aryl, substituted (as herein defined) aryl, or -SO<sub>2</sub>D or -C(=O)D where D is C<sub>1</sub>-C<sub>6</sub> alkyl, aryl, substituted (as herein defined) aryl or amino;

The optional substituent(s) to Ar<sub>1</sub> comprise one or two members independently selected from the group consisting H, fluoro, bromo, chloro, hydroxy, methoxy, ethoxy, amino, dimethylamino, acetyl, propionyl, butyryl and the like. Where Ar<sub>2</sub> is a six membered ring, the optional substituents are conveniently located at positions 2 and/or 6 relative to the linkage to the rest of the molecule.

Carboxy, carboxymethyl and

25

30

carbamoyl include the corresponding pharmaceutically acceptable C<sub>1</sub>-C<sub>6</sub> alkyl and aryl esters.

Particularly preferred compounds of the present invention have the formula

5 P-2:

wherein

R8 is halo, especially halo;

10 R9 is C<sub>1</sub>-C<sub>3</sub> alkyl;

R10 is halo or cyano;

and L\*Rx is as defined above.

A preferred subset of compounds within Formula P2, particularly with regard  
15 to pharmacokinetics, has R10 as cyano. A further favoured subset of compounds within Formula P2, particularly with regard to ease of forming prodrugs, comprise compounds wherein R10 is bromo.

Preferably R8 is chloro and more preferably fluoro. Suitable R9 groups include methyl, isopropyl, n-propyl and preferably ethyl.

20

As depicted in Formula P2, the cyclopropyl ring is in the *cis* configuration, allowing two enantiomers, 1S, 2S and 1R, 2R

25 Each of these enantiomers are potent antiretrovirals, although the different enantiomers can display subtle differences in physiological properties. For

instance the 1S, 2S and 1R,2R enantiomers can show a different pattern of metabolism within the P450 system. The 1S,2S enantiomer of compounds wherein Rp10 is cyano is particularly preferred as it appears unique in being able to avoid key components of the P450 system. Other retroviral agents  
5 such as the HIV protease inhibitor ritonavir interact extensively with the P450 system, leading to an array of undesirable physiological responses including extensive alteration of the metabolism of other co-administered drugs. This is of particular concern with pharmaceuticals administered for a chronic infection where patients can expect to take a number of pharmaceuticals for years, if  
10 not decades.

Preferred NNRTI mother compounds for preparing prodrugs in accordance with the invention thus include:

(1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-propionylphenyl)-cyclopropyl]-N'-(5-cyanopyrid-2-yl)-urea,  
15 (1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-butyrylphenyl)-cyclopropyl]-N'-(5-cyanopyrid-2-yl)-urea,  
(1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-acetylphenyl)-cyclopropyl]-N'-(5-cyanopyrid-2-yl)-urea,  
20 (1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-propionylphenyl)-cyclopropyl]-N'-(5-bromopyrid-2-yl)-urea,  
(1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-butyrylphenyl)-cyclopropyl]-N'-(5-bromopyrid-2-yl)-urea,  
(1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-acetylphenyl)-cyclopropyl]-N'-(5-bromopyrid-2-yl)-urea,  
25 and the corresponding 1R, 2R enantiomers.

As the compounds of formula P1 and in particular P2 generally include an electron withdrawing group on the phenol/heteroaryl ring to which the  
30 prodrug moiety is attached, it is generally preferred to avoid a simple ester linkage for L\*. Accordingly L\* preferably comprises an ether or carbonate linkage to the phenolic (or other heteroaryl) hydroxy of the mother compound. A particularly convenient ether linkage has the formula:

Where PETH is the dehydroxy residue of the NNRTI, the arrowed oxygen is the phenolic (or other heterocyclic) hydroxy, Ry and Ry' are independently H or C<sub>1</sub>-C<sub>3</sub> alkyl and A is the esterified amino acid residue Rx. Alternatively, A can comprise an intermediate linking moiety to which Rx is esterified. Examples of such an intermediate linking moiety include a straight or branched chain hydroxycarboxylic acid derivative, such as 3-hydroxypropionate, 4-hydroxybutyrate and in particular L-lactic acid, wherein the carboxy function is esterified to the non-arrowed oxygen above and the hydroxy function is esterified to the amino acid. The intermediate linking moiety may comprise an aryl or heteroaryl component bearing an (alkylenyl)carboxy function amenable for esterification with the amino acid of Rx. The form and preparation of linking groups suitable for use in the compounds of the invention is extensively described in our copending application no PCT/SE99/00194, the contents of which are incorporated by reference.

Alternatively A as an intermediate linking moiety can comprise a carbonate linkage to the alkyloxy group depicted above, in which case A further comprises a branched or straight chain hydroxycarboxylic acid derivative amenable to esterification with the amino acid of Rx. Similarly a carbonate linkage bearing A moiety may comprise an aryl or heteroaryl component bearing an (alkylenyl)carboxy function amenable for esterification with the amino acid of Rx.

25

Thus a convenient group of prodrugs within the scope of the invention include those of the formula P3:

wherein

- 5 R8, R9, R10 are as described above;  
 Ry and Ry' are independently H or C<sub>1</sub>-C<sub>3</sub> alkyl;

 and pharmaceutically acceptable salts thereof.
- 10 Typically both of Ry and Ry' are H. Rx is preferably the ester residue of an aliphatic amino acid such as alanine, tertiary leucine or leucine, preferably isoleucine and especially valine, Preferably Rx is derived from an L-amino acid.
- 15 Preferred compounds within Formula P3 thus include;

 25 (1S, 2S)-N-{*cis*-2-[6-fluoro-2-(L-isoleucyloxymethoxy)-3-propionylphenyl]cyclopropyl}-N'-[2-(5-bromopyridyl)]urea,

(1R, 2R)-N-{*cis*-2-[6-fluoro-2-(L-valyloxymethyloxy)-3-propionylphenyl]cyclopropyl}-N'-[2-(5-bromopyridyl)]urea,  
(1R, 2R)-N-{*cis*-2-[6-fluoro-2-(L-isoleucyloxymethyloxy)-3-propionylphenyl]cyclopropyl}-N'-[2-(5-bromopyridyl)]urea,  
and pharmaceutically acceptable salts thereof.

An alternative preferred group of prodrugs of the invention have the Formula P4:

Typically both of Ry and Ry' are H. Rx is preferably the ester residue of an aliphatic amino acid such as alanine, tertiary leucine or leucine, preferably isoleucine and especially valine, Preferably Rx is derived from an L-amino acid.

- The invention further provides pharmaceutical compositions comprising the compounds of formula P1 and pharmaceutically acceptable carriers or diluents therefor. Additional aspects of the invention provide methods for the inhibition of HIV comprising administering a compound of the formula I to a  
 25 subject afflicted with HIV. The invention also extends to the use of the compounds of formula I in therapy, such as in the preparation of a medicament for the treatment of HIV infections.

In treating conditions caused by HIV, the compounds of formula I are preferably administered in an amount to achieve a plasma level of the compounds of Formula P1 of around 10 to 1000 nM and more preferably 100 to 500 nM. This corresponds to a dosage rate, depending on the  
5 bioavailability of the formulation, of the order 0.01 to 10 mg/kg/day, preferably 0.1 to 2 mg/kg/day. A typical dosage rate for a normal adult will be around 0.05 to 5 g per day, preferably 0.1 to 2 g such as 500-750 mg, in one to four dosage units per day.

10 In keeping with the usual practice with HIV inhibitors it is advantageous to co-administer one to three additional antivirals to provide synergistic responses and to ensure complementary resistance patterns. Such additional antivirals may include AZT, ddl, ddC, D4T, 3TC, abacavir, adefovir, adefovir dipivoxil, bis-POC-PMPA, foscarnet, hydroxyurea, Hoechst-Bayer HBY 097,  
15 efavirenz, trovirdine, nevirapine, delaviridine, PFA, H2G (tamociclovir), ABT 606 (valtamociclovir stearate) DMP-450, loviride, ritonavir, saquinavir, indinavir, amprenavir (Vertex VX 478), nelfinavir and the like, typically at molar ratios reflecting their respective activities and bioavailabilities. Generally such ratio will be of the order of 25:1 to 1:25, relative to the compound of formula I.

20 Compounds of the invention are typically prepared by alkylation of the corresponding mother compounds of Formula P1 or especially P2, which are prepared by conventional means, such as the methodology described in WO95/06034 or PCT/SE99/00053.

25 In particular, the preparation of compounds of formula P-3 or P-4 generally proceeds by alkylation using conventional coupling conditions of a compound of the formula P-2 with the corresponding intermediate:

where  $R_y$ ,  $R_{y'}$  and  $L$  are as defined above and  $R_x$ -PG is  $R_x$  as defined, but N-protected with a conventional N-protecting group. Preferably the halogen activating group is iodo, which is in turn prepared by iodination of the corresponding chloro analogue. Typical coupling conditions include treatment  
5 with a base in an organic solvent such as THF prior to addition of the activated (halogenated) intermediate followed by conventional deprotection of the  $R_x$  N-protecting group.

Compounds of formula P8 are generally prepared by esterification of a  
10 compound of the formula P2 with an intermediate of the formula:

where  $\text{Alk}^{b*}$  is a functionalised  $\text{Alk}^b$  as described above, for example chloromethyl chloroformate, in an organic solvent, followed by iodination of  
15 the terminal chloro with  $\text{NaI}$  (or other activation of the functionalising group) and esterification/alkylation with an N-protected  $R_x$ .

After coupling of the activated  $L^*$ -(N-protected)- $R_x$  group to the mother NNRTI (or the two step coupling of the activated  $L^*$  moiety followed by coupling of the  
20 N-protected  $R_x$ ) the N-protecting group on the amino acid  $R_x$  is removed by conventional techniques such as palladium catalysed reduction or treatment with an organic acid such as trifluoroacetic acid.

25 Typical intermediates for a one step coupling thus comprise  
iodomethyloxy-N-CBz-valyl,  
iodomethyloxy-N-Boc-valyl,  
iodomethyloxy-N-Fmoc-valyl  
iodomethyloxy-N-CBz-isoleucyl,

Although the above list describes Boc and CBz N-protecting groups on the amino acid, it will be appreciated that other N-protecting groups are also available.

- 5 Copending international application no PCT/SE99/00194 comprehensively describes the preparation of analogous intermediates.

The term "N-protecting group" or "N-protected" as used herein refers to those groups intended to protect the N-terminus of an amino acid or peptide or to  
10 protect an amino group against undesirable reactions during synthetic procedures. Hydroxy and/or carboxy protecting groups are also extensively reviewed in  
5 Greene *ibid* and include ethers such as methyl, substituted methyl ethers such as methoxymethyl, methylthiomethyl, benzyloxymethyl, t-butoxymethyl, 2-methoxyethoxymethyl and the like, silyl ethers such as trimethylsilyl (TMS), t-butyltrimethylsilyl (TBDMS) tribenzylsilyl, triphenylsilyl, t-butyltriphenylsilyl triisopropyl silyl and the like, substituted ethyl ethers such as 1-ethoxymethyl,

While it is possible for the active agent to be administered alone, it is preferable to present it as part of a pharmaceutical formulation. Such a formulation will comprise the above defined active agent together with one or more acceptable carriers or excipients and optionally other therapeutic ingredients. The carrier(s) must be acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient.

The formulations include those suitable for rectal, nasal, topical (including buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration, but preferably the formulation is an orally administered formulation. The formulations may conveniently be presented in unit dosage form, e.g. tablets and sustained release capsules, and may be prepared by any methods well known in the art of pharmacy.

Such methods include the step of bringing into association the above defined active agent with the carrier. In general, the formulations are prepared by uniformly and intimately bringing into association the active agent with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product. The invention extends to methods for preparing a pharmaceutical composition comprising bringing a compound of Formula I or its pharmaceutically acceptable salt in conjunction or association with a pharmaceutically acceptable carrier or vehicle. If the manufacture of pharmaceutical formulations involves intimate mixing of pharmaceutical excipients and the active ingredient in salt form, then it is often preferred to use excipients which are non-basic in nature, i.e. either acidic or neutral. Formulations for oral administration in the present invention may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active agent; as a powder or granules; as a solution or a suspension of the active agent in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water in oil liquid emulsion and as a bolus etc.

With regard to compositions for oral administration (e.g. tablets and capsules), the term suitable carrier includes vehicles such as common excipients e.g. binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, polyvinylpyrrolidone (Povidone), methylcellulose, ethylcellulose, sodium carboxymethylcellulose, hydroxypropylmethylcellulose, sucrose and starch; fillers and carriers, for example corn starch, gelatin, lactose, sucrose, microcrystalline cellulose, kaolin, mannitol, dicalcium phosphate, sodium chloride and alginic acid; and lubricants such as magnesium stearate, sodium stearate and other metallic stearates, stearic acid, glycerol stearate, silicone fluid, talc waxes, oils and colloidal silica. Flavouring agents such as peppermint, oil of wintergreen, cherry flavouring or the like can also be used. It may be desirable to add a colouring agent to make the dosage form readily identifiable. Tablets may also be coated by methods well known in the art. A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active agent in a free flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may be optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active agent.

Other formulations suitable for oral administration include lozenges comprising the active agent in a flavoured base, usually sucrose and acacia or tragacanth; pastilles comprising the active agent in an inert base such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active agent in a suitable liquid carrier.

#### Bioavailability

The release of a compound of Formula P-2 from orally administered prodrugs of Formulae P3 to P8 were monitored in rats. The compounds of Examples 1 to 6 were made up in a propylene glycol vehicle and orally administered to paired fasted male Sprague Dawley rats at a dose corresponding to 0.027 mmol/kg. At 30, 60, 120, 240 & 360 minutes, 0.2 ml blood were collected, centrifuged and frozen for later analysis. of any additional fee.

covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
